

# PROJECT PROPOSAL

## TITLE

### CITY TOUR GUIDE

## SUBJECT AREA

DATABASE SYSTEMS: Object oriented databases.

## AIM

City Travel Guide is a project to create a free, complete, up-to-date and reliable worldwide travel guide. In our database we aim to provide virtual tours of approximately a dozen of destination cities from around the globe. Along with the images and comments left by other tourists. The system would be able to suggest a suitable travel spot to a customer based on his taste and preferences.

## ARGUMENTS

Tourism forms an integral part of any economy. Tourism promotes development of an area. The potential problems that a tourist may face include

1. Lack of information about the nearest airports, railway stations and other means of transport connecting the tourist spot with the rest of the world.
2. Lack of proper information about hotels and restaurants in the area eventually leading the tourist dissatisfaction.
3. The sights of interest and their historic relevance in regard to culture and ethnic beliefs of the people of the region.
4. Communication gap between the tourists and natives due to language barriers.

Our project aims to overcome all these impediments by storing adequate amount of latest data pertaining to these issues and solving them in a cost effective manner.

## OBJECTIVES

- To construct a full proof city tour guide software system, which enables users to tour different cities around the globe virtually on their computers in just a click of the mouse.
- The virtual tour should provide the user with the history of that place as well as information on hotels, resorts and restaurants in the area catering to the needs of tourists.

- To provide users with images of flora and fauna of the region which can appeal to their aesthetic curiosity.
